To Our Wives

Preface to the First Edition

The attempt to understand the physics of the structure of stars and their change in time – their evolution – has been bothering many physicists and astronomers ever since the last century. This long chain of successful research is well documented not only by numerous papers in the corresponding journals but also by a series of books. Some of them are so excellently written that despite their age they can still be recommended and not only as documents of the state of the art at that time. A few outstanding examples are the books of Emden (1907), Eddington (1926), Chandrasekhar (1939), and Schwarzschild (1958). But our science has rapidly expanded in the last few decades, and new aspects have emerged which could not even be anticipated, say, 30 years ago and which today have to be carefully explored.

This does not mean, however, that our ambition is to present a complete account of the latest and most refined numerical results. This can well be left to the large and growing number of excellent review articles. This book is intended rather to be a textbook that will help students and teachers to understand these results as far as possible and present them in a simple and clear manner. We know how difficult this is since we ourselves have tried for the largest part of our scientific career to understand “how the stars work” – and then to make others believe it. In these attempts we have found that often enough a simplified analytical example can be more helpful than the discussion of an exceptionally beautiful numerical solution. Therefore we do not hesitate to include many simple considerations and estimates, if necessary, even at the expense of rigour and the latest results. The reader should also note that the list of references given in this book is not intended to represent a table of honour for the (known and unknown) heroes of the theory of stellar structure; it is merely designed to help the beginner to find a few first paths in the literature jungle and presents those papers from which we have more or less randomly chosen the numbers for figures and numerical examples (There are others of at least the same quality!).

The choice of topics for a book such as this is difficult and certainly subject to personal preferences. Completeness is neither possible nor desirable. Still, one may wonder why we did not include, for example, binary stars, although we are obviously interested in their evolution. The reason is that here one would have had

to include the physics of essentially non-spherical objects (such as disks), while we concentrate mainly on spherical configurations; even in the brief description of rotation the emphasis is on small deviations from spherical symmetry.

This book would never have been completed without the kind and competent help of many friends and colleagues. We mention particularly Wolfgang Duschl and Peter Schneider who read critically through the whole manuscript; Norman Baker, Gerhard Börner, Mounib El Eid, Wolfgang Hillebrandt, Helmuth Kahler, Ewald Müller, Henk Spruit, Joachim Wambsganß, and many others read through particular chapters and gave us their valuable advice. In fact it would probably be simpler to give a complete list of those of our colleagues who have *not* contributed than of those who helped us.

In addition we have to thank many secretaries at our institutes; several have left their jobs (for other reasons!) during the five years in which we kept them busy. Most of this work was done by Cornelia Rickl and Petra Berkemeyer in Munich and Christa Leppien and Heinke Heise in Hamburg, while Gisela Wimmersberger prepared all the graphs. We are grateful to them all.

Finally we wish to thank Springer-Verlag for their enthusiastic cooperation.

Preface to the Second Edition

Twenty years after its first publication, this textbook is still a major reference for scientists and students interested in or working on problems of stellar structure and evolution. But with the incredible growth of computational power, the computation of stellar models has to large extent become a standard tool for astrophysics. While the early computations were restricted to single choices for mass, compositions and possibly evolutionary stage, by now models for the whole parameter space exist. The first edition of this book was restricted to a few examples for low- and intermediate-mass star evolution and lacked the broader view now being possible. There are even semi-automatic stellar evolution codes that may be used remotely via the Internet.

However, stellar evolution programs should not be used without a thorough understanding of the stellar physics. Therefore, a textbook concentrating on the foundations of the theory and explaining in detail specific phases and events in the life of a star is very much needed to allow scientifically solid modelling of stars. This is the reason why this book deserved a second edition.

Much to our regret, A. Weigert passed away two years after publication of the first edition. He left a gap that cannot be filled. Given the above mentioned need for a second edition and the requirement to add up-to-date stellar models, it was decided to have A. Weiss join R. Kippenhahn in preparing the new edition.

The two authors of this book came to discriminate between the *eternal truth* and the *mutable* parts. The latter ones refer to the current state of modelling and knowledge obtained from numerical models and their comparison to observations. Such chapters were updated, extended, or added. As far as possible, the stellar models shown were specifically calculated for this purpose, with the present, much evolved version of the original code by Kippenhahn, Weigert, and Hofmeister. The numerical results are therefore much more homogeneous and consistent than in the first edition.

The *eternal truth* concerns the aforementioned basic physics and their understanding. These parts of the book have been left almost untouched, since the authors (and those readers who were consulted) did not see any reason to change them.

The authors are indebted to many friends and colleagues who gave their advice or comments, with respect to both necessary changes and the new text passages.

The support of Santi Cassisi, Jørgen Christensen-Dalsgaard, Wolfgang Hillebrandt, Thomas Janka, Ralf Klessen, Ewald Müller, Hans Ritter, Maurizio Salaris, and Helmut Schlattl was essential for us.

We are also very grateful to all those colleagues who very generously provided their own data to help filling gaps that we could not fill with our own models. They were (again in alphabetical order) Leandro Althaus, Isabelle Baraffe, Raphael Hirschi, Marco Limongi, Marcelo Miller Bertolami, Aldo Serenelli, and Lionel Siess. Needless to say, their data also came with much wanted and helpful advice and sometimes fruitful scientific discussions about details of the models.

Norbert Grüner's help in the difficult task of generating a useful index is acknowledged, too.

Last, but not least, we thank Mrs. Rosmarie Mayr-Ihbe, who designed, corrected, and improved the many figures that we added to this second edition.

Contents

Part I The Basic Equations

1	Coordinates, Mass Distribution, and Gravitational Field in Spherical Stars	3
1.1	Eulerian Description	3
1.2	Lagrangian Description	4
1.3	The Gravitational Field	6
2	Conservation of Momentum	9
2.1	Hydrostatic Equilibrium	9
2.2	The Role of Density and Simple Solutions	10
2.3	Simple Estimates of Central Values P_c, T_c	12
2.4	The Equation of Motion for Spherical Symmetry	13
2.5	The Non-spherical Case	15
2.6	Hydrostatic Equilibrium in General Relativity	15
2.7	The Piston Model	17
3	The Virial Theorem	19
3.1	Stars in Hydrostatic Equilibrium	19
3.2	The Virial Theorem of the Piston Model	21
3.3	The Kelvin–Helmholtz Timescale	22
3.4	The Virial Theorem for Non-vanishing Surface Pressure	23
4	Conservation of Energy	25
4.1	Thermodynamic Relations	25
4.2	The Perfect Gas and the Mean Molecular Weight	28
4.3	Thermodynamic Quantities for the Perfect, Monatomic Gas	30
4.4	Energy Conservation in Stars	31
4.5	Global and Local Energy Conservation	33
4.6	Timescales	35

5	Transport of Energy by Radiation and Conduction	37
5.1	Radiative Transport of Energy	37
5.1.1	Basic Estimates	37
5.1.2	Diffusion of Radiative Energy	38
5.1.3	The Rosseland Mean for κ_{ν}	40
5.2	Conductive Transport of Energy	42
5.3	The Thermal Adjustment Time of a Star	43
5.4	Thermal Properties of the Piston Model	45
6	Stability Against Local, Non-spherical Perturbations	47
6.1	Dynamical Instability	47
6.2	Oscillation of a Displaced Element	52
6.3	Vibrational Stability	54
6.4	The Thermal Adjustment Time	55
6.5	Secular Instability	56
6.6	The Stability of the Piston Model	58
7	Transport of Energy by Convection	61
7.1	The Basic Picture	62
7.2	Dimensionless Equations	65
7.3	Limiting Cases, Solutions, Discussion	66
7.4	Extensions of the Mixing-Length Theory	70
8	The Chemical Composition	73
8.1	Relative Mass Abundances	73
8.2	Variation of Composition with Time	74
8.2.1	Radiative Regions	74
8.2.2	Diffusion	76
8.2.3	Convective Regions	80
9	Mass Loss	83
 Part II The Overall Problem		
10	The Differential Equations of Stellar Evolution	89
10.1	The Full Set of Equations	89
10.2	Timescales and Simplifications	91
11	Boundary Conditions	93
11.1	Central Conditions	93
11.2	Surface Conditions	95
11.3	Influence of the Surface Conditions and Properties of Envelope Solutions	98
11.3.1	Radiative Envelopes	98
11.3.2	Convective Envelopes	101
11.3.3	Summary	102
11.3.4	The $T-r$ Stratification	102

12 Numerical Procedure	105
12.1 The Shooting Method	105
12.2 The Henyey Method	106
12.3 Treatment of the First- and Second-Order Time Derivatives	113
12.4 Treatment of the Diffusion Equation	115
12.5 Treatment of Mass Loss	117
12.6 Existence and Uniqueness	118
 Part III Properties of Stellar Matter	
13 The Perfect Gas with Radiation	123
13.1 Radiation Pressure	123
13.2 Thermodynamic Quantities	124
14 Ionization	127
14.1 The Boltzmann and Saha Formulae	127
14.2 Ionization of Hydrogen	130
14.3 Thermodynamical Quantities for a Pure Hydrogen Gas	132
14.4 Hydrogen–Helium Mixtures	133
14.5 The General Case	135
14.6 Limitation of the Saha Formula	137
15 The Degenerate Electron Gas	139
15.1 Consequences of the Pauli Principle	139
15.2 The Completely Degenerate Electron Gas	140
15.3 Limiting Cases	144
15.4 Partial Degeneracy of the Electron Gas	145
16 The Equation of State of Stellar Matter	151
16.1 The Ion Gas	151
16.2 The Equation of State	152
16.3 Thermodynamic Quantities	154
16.4 Crystallization	157
16.5 Neutronization	158
16.6 Real Gas Effects	159
17 Opacity	163
17.1 Electron Scattering	163
17.2 Absorption Due to Free–Free Transitions	164
17.3 Bound–Free Transitions	165
17.4 Bound–Bound Transitions	166
17.5 The Negative Hydrogen Ion	168
17.6 Conduction	169
17.7 Molecular Opacities	170
17.8 Opacity Tables	172

18	Nuclear Energy Production	175
18.1	Basic Considerations	175
18.2	Nuclear Cross Sections	179
18.3	Thermonuclear Reaction Rates	182
18.4	Electron Shielding	188
18.5	The Major Nuclear Burning Stages	192
	18.5.1 Hydrogen Burning	193
	18.5.2 Helium Burning	197
	18.5.3 Carbon Burning and Beyond	199
18.6	Neutron-Capture Nucleosynthesis	201
18.7	Neutrinos	205
Part IV Simple Stellar Models		
19	Polytropic Gaseous Spheres	213
19.1	Polytropic Relations	213
19.2	Polytropic Stellar Models	215
19.3	Properties of the Solutions	216
19.4	Application to Stars	218
19.5	Radiation Pressure and the Polytrope $n = 3$	219
19.6	Polytropic Stellar Models with Fixed K	220
19.7	Chandrasekhar's Limiting Mass	221
19.8	Isothermal Spheres of an Ideal Gas	222
19.9	Gravitational and Total Energy for Polytropes	224
19.10	Supermassive Stars	226
19.11	A Collapsing Polytrope	227
20	Homology Relations	233
20.1	Definitions and Basic Relations	233
20.2	Applications to Simple Material Functions	237
	20.2.1 The Case $\delta = 0$	237
	20.2.2 The Case $\alpha = \delta = \varphi = 1, a = b = 0$	237
	20.2.3 The Role of the Equation of State	239
20.3	Homologous Contraction	241
21	Simple Models in the $U-V$ Plane	243
21.1	The $U-V$ Plane	243
21.2	Radiative Envelope Solutions	246
21.3	Fitting of a Convective Core	248
21.4	Fitting of an Isothermal Core	250
22	The Zero-Age Main Sequence	251
22.1	Surface Values	251
22.2	Interior Solutions	254
22.3	Convective Regions	258
22.4	Extreme Values of M	260
22.5	The Eddington Luminosity	261

23	Other Main Sequences	263
23.1	The Helium Main Sequence	263
23.2	The Carbon Main Sequence	266
23.3	Generalized Main Sequences	267
24	The Hayashi Line	271
24.1	Luminosity of Fully Convective Models	272
24.2	A Simple Description of the Hayashi Line	273
24.3	The Neighbourhood of the Hayashi Line and the Forbidden Region	276
24.4	Numerical Results	279
24.5	Limitations for Fully Convective Models	281
25	Stability Considerations	283
25.1	General Remarks	283
25.2	Stability of the Piston Model	285
25.2.1	Dynamical Stability	285
25.2.2	Inclusion of Non-adiabatic Effects	286
25.3	Stellar Stability	288
25.3.1	Perturbation Equations	289
25.3.2	Dynamical Stability	290
25.3.3	Non-adiabatic Effects	292
25.3.4	The Gravothermal Specific Heat	293
25.3.5	Secular Stability Behaviour of Nuclear Burning	294

Part V Early Stellar Evolution

26	The Onset of Star Formation	299
26.1	The Jeans Criterion	299
26.1.1	An Infinite Homogeneous Medium	299
26.1.2	A Plane-Parallel Layer in Hydrostatic Equilibrium	302
26.2	Instability in the Spherical Case	303
26.3	Fragmentation	307
27	The Formation of Protostars	311
27.1	Free-Fall Collapse of a Homogeneous Sphere	311
27.2	Collapse onto a Condensed Object	313
27.3	A Collapse Calculation	314
27.4	The Optically Thin Phase and the Formation of a Hydrostatic Core	315
27.5	Core Collapse	317
27.6	Evolution in the Hertzsprung–Russell Diagram	320
